Prostate cancer (PCa) is one of the major leading cause in men and no effective biomarkers or therapy have been approved for it to date. This study aimed to explore the molecular mechanisms and identify the potential molecular biomarkers of PCa.

The microarray profile GSE38241 including 18 prostate cancer metastasis and 21 normal prostate samples was retrieved from the Gene Expression Omnibus (GEO) database. Differentially expressed genes (DEGs) were identified by Limma. DEGs functions were investigated by Gene Ontology (GO) and pathway enrichment analysis. Moreover, protein-protein interaction (PPI) network of DEGs was constructed, followed by functional analysis of modules. Additionally, pathway crosstalk network was constructed by integrating PPI network and Kyoto encyclopedia of genes and genomes (KEGG) pathways.

Totally, 334 up – and 703 down-regulated DEGs were identified. The functions of up-regulated DEGs were significantly enriched in GO terms of cell cycle phase and cell cycle process. While down-regulated DEGs mainly participated in actin filament-based process. Among these pathways in the pathway crosstalk network, T cell receptor signaling pathway, chemokine signaling pathways, endometrial cancer and glioma were found to play critical roles during PC progression.

Cell division cycle 45 (CDC45), baculoviral IAP repeat containing 5 (BIRC5) and cell division cycle associated 5 (CDC5) may be useful markers for predicting tumor metastasis and therapeutic targets for the treatment of PCa patients. Moreover, the pathway crosstalk network provides the groundwork that targeting multiple pathways might be more effective than targeting one pathway alone.

Key words: prostate cancer, differentially expressed genes, protein-protein interaction network, pathway crosstalk

Prostate cancer (PCa) is a kind of malignancy resulting from the pathological changes in men's prostate tissue [1]. PCa is the most commonly diagnosed cancer for men in American and is by far the second leading cause of cancer-related death in men [2]. Moreover, recurrence rate remains about 15% within 5 years after prostatectomy and approximately 40% within 10 years [3]. The mortality rate of PCa patients is higher even after prostatectomy, hormone therapy or radiation [4]. Despite the high incidence rate as well as high mortality rate, the etiology of PCa still remains largely unknown. Thus, more efforts should be devoted for exploring the molecular mechanism and identifying molecular targets to prevent PCa metastases during the early stage to improve the prognosis of PCa patients.

Recently, considerable researches were undertaken to explore the molecular mechanism of PCa. Some genes have been identified to be aberrant in PCa. The six-transmembrane epi-

thelial antigen of prostate 1 (STEAP1) gene overexpression has been reported in PCa [5]. Recently, Neto *et al.* have reported a significant, direct link between human epidermal growth factor receptor 2 (HER2/neu over-expression and recurrence and death risk in PCa patients [4]. Additionally, the mutation in β -catenin has been reported in PCa [6]. A previous study has suggested that insulin-like growth factor-1 (IGF-1) signaling involved in PCa development through blocking apoptosis and promoting cancer cell proliferation and invasion [7, 8]. Recent study has demonstrated that focal adhesion pathway is of special importance to the development and the progression of human PCa [9]. Additionally, Wnt/ β -catenin is one of the most influential pathways on both human and rat PCa cell growth [10]. However, PCa complexity is not only the combination of proteins in the pathways but also the interactions of the crosstalk of these pathways [11, 12]. Recently, the cross-talk among different signaling pathways has been

demonstrated to play a crucial role in PCa: the inhibition of IGF-1 reduced the β -catenin signaling. Wnt/ β -catenin inhibition subsequently resulted in an inhibition of the T-cell factor/lymphoid enhancer factor dependent transcriptional activity and effective inhibition of PCa cell growth [13]. The cooperation of Wnt signaling pathway and Notch signaling pathway is also found in PCa [14].

In the current study, microarray data GSE38241 [15] was employed to identify differentially expressed genes (DEGs) between PCa metastasis and normal prostate samples. Through some studies have analyzed the datasets for biomarkers and small molecules drugs of metastatic prostate carcinoma [9, 16], a large amount of information in the dataset still remain to be discovered. In this study, in addition to the Gene Ontology (GO) and pathway enrichment analysis of DEGs, the protein-protein interaction (PPI) network was constructed, followed by functional analysis of modules. Additionally, the pathway crosstalk network was constructed among PCa-related pathways by integrating PPI and Kyoto encyclopedia of genes and genomes (KEGG) pathways information. Therefore, this research will light the further understanding of molecular mechanisms of PCa. Meanwhile, this may provide new insight into the therapy for it.

Materials and methods

Data source. The mRNAs expression profile of GSE38241 [15] which was generated by Aryee *et al.* based on GPL4133 (Agilent-014850 Whole Human Genome Microarray 4x44K G4112F (Feature Number version) was downloaded from the Gene Expression Omnibus (GEO) database (<http://www.ncbi.nlm.nih.gov/geo/>). A total of 39 mRNA chips were available, including 18 PC metastasis samples and 21 normal prostate samples. The raw data files and the probe annotation files were obtained and used for further analysis.

Data preprocessing. The probe ID was converted into gene symbol based on the annotation of the platform. Probes with at least one defective expression values were abandoned. For each sample, the expression values of all probe set that map to a given gene were reduced and averaged to a single value. Then, the data were normalized using PreprocessCore package [17]. Finally, the gene expression matrix was obtained.

Identification of DEGs. Based on data preprocessing, the limma package [18] in R language was performed to identify DEGs between PCa metastasis samples and normal prostate samples. $|\log_2 \text{fold change (FC)}| > 1$ and $\text{FDR} < 0.05$ were used as the cut-off criterion of DEGs. The raw p values were adjusted to false discovery rates (FDR) on the basis of Benjamini & Hochberg method [19].

GO and pathway enrichment analysis of DEGs. According to GO Database (<http://www.geneontology.org/>), GO annotation was performed to analyze the functions of DEGs between PCa metastasis samples and normal prostate samples. GO analysis has been used as functional enrichment studies of large-scale genes frequently [20]. GenCLIP 2.0, which is

a web-based text-mining server for gene clustering and molecular networks construction, was applied to perform the GO analysis [21]. A $p \leq 0.05$ and $\text{Hit} \geq 10$ were the cutoff criterions for GO categories.

KEGG databases cover all kinds of biochemistry pathways [22]. GenCLIP 2.0 was applied for KEGG pathway enrichment analysis of DEGs. A $p \leq 0.05$ was chosen as the cut off value.

PPI network construction and functional analysis of modules. The Human Protein Reference Database (HPRD) [23] is a protein database accessible through the internet. A total of 39240 PPI pairs were obtained from HPRD. The Search Tool for the Retrieval of Interacting Genes (STRING) [24] database offers both experimental and predicted interaction information. STRING database was applied to construct the PPI network.

Then, the edges and nodes of the PPI network were so complicated, there is a need for further analysis to expose the enriched functional modules of the PPI network using Cytoscape and ClusterOne [25, 26]. Finally, GO and pathway enrichment analysis of modules was performed.

Significance analysis of pathway crosstalk under PPI and KEGG data. All human pathways were collected from KEGG database. The pathway of PCa was screened as host pathway. The candidate pathways were obtained with at least a protein overlap between any given pair of pathways.

Pearson correlation coefficient (PCC) was applied to calculate the similarity of gene expression and weight pairwise gene co-expression in PCa. Then, p-values mapping to nodes and edges in the PPI network were calculated and obtained. The following formula [27] was performed to assess and measure statistical significance of functional interactions by a scoring scheme.

$$S(e) = f(\text{diff}(x), \text{corr}(x, y), \text{diff}(y))$$

$$= -2 \sum_{i=1}^k \log_e(p_i)$$

Where the $\text{diff}(x)$ and $\text{diff}(y)$ represented the quantitative assessment in differential gene expression of gene x and gene y, respectively; $\text{corr}(x, y)$ represented their correlation strength between gene x and gene y based on the expression levels; f represented a general method in data integration taking account of multiple data sets across a variety of statistical power; Where $k = 3$, p_1 and p_2 indicated the statistical significance (p-values) of differential expression of two nodes, while p_3 referred to their co-expression strength (p-value).

To determine the significance of a pathway P , the scores of all edges $S(e)$ of every pathway were summarized as S_P . To assess statistical significance of this pathway, p-values were obtained and calculated from 1000 randomly generated pathways with the same size. Score frequency that larger than S_P was used as the significant p-value of pathway P to describe its importance. We considered the pathway with the p-value < 0.05 as the significant pathway.

Disease Ontology (DO) annotation of DEGs. To identify a direct link between human cancer and DEGs, TargetMine (<http://targetmine.nibio.go.jp/>) which is an integrated data warehouse for known disease-associated genes was used for retrieval of candidate target genes and proteins for cancer from large-scale experiments. Additionally, DEGs have been reported to play roles in cancer pathogenesis would be identified to validate the results.

Results

Identification of DEGs. Heatmap in Figure 1 displayed the differential gene expression between prostate cancer

metastasis and normal prostate samples (Supplemental Table 1). After preprocessing, 1037 DEGs were identified, including 334 up – and 703 down-regulated DEGs (Supplemental Table 2). Alpha-methylacyl-CoA racemase (AMACR, $\log_2 FC = 3.263$) and actin, gamma 2, smooth muscle, enteric (ACTG2, $\log_2 FC = -5.945$) had the highest fold changes among the up – and down-regulated genes, respectively.

GO and pathways enriched by DEGs. The top 3 clusters of GO terms which were most significantly enriched by DEGs were shown in Table 1. Up-regulated DEGs were significantly enriched in cell cycle phase ($p = 4.56E-12$), chromosome segregation ($p = 1.80E-10$) and cell cycle process ($p = 2.49E-08$).

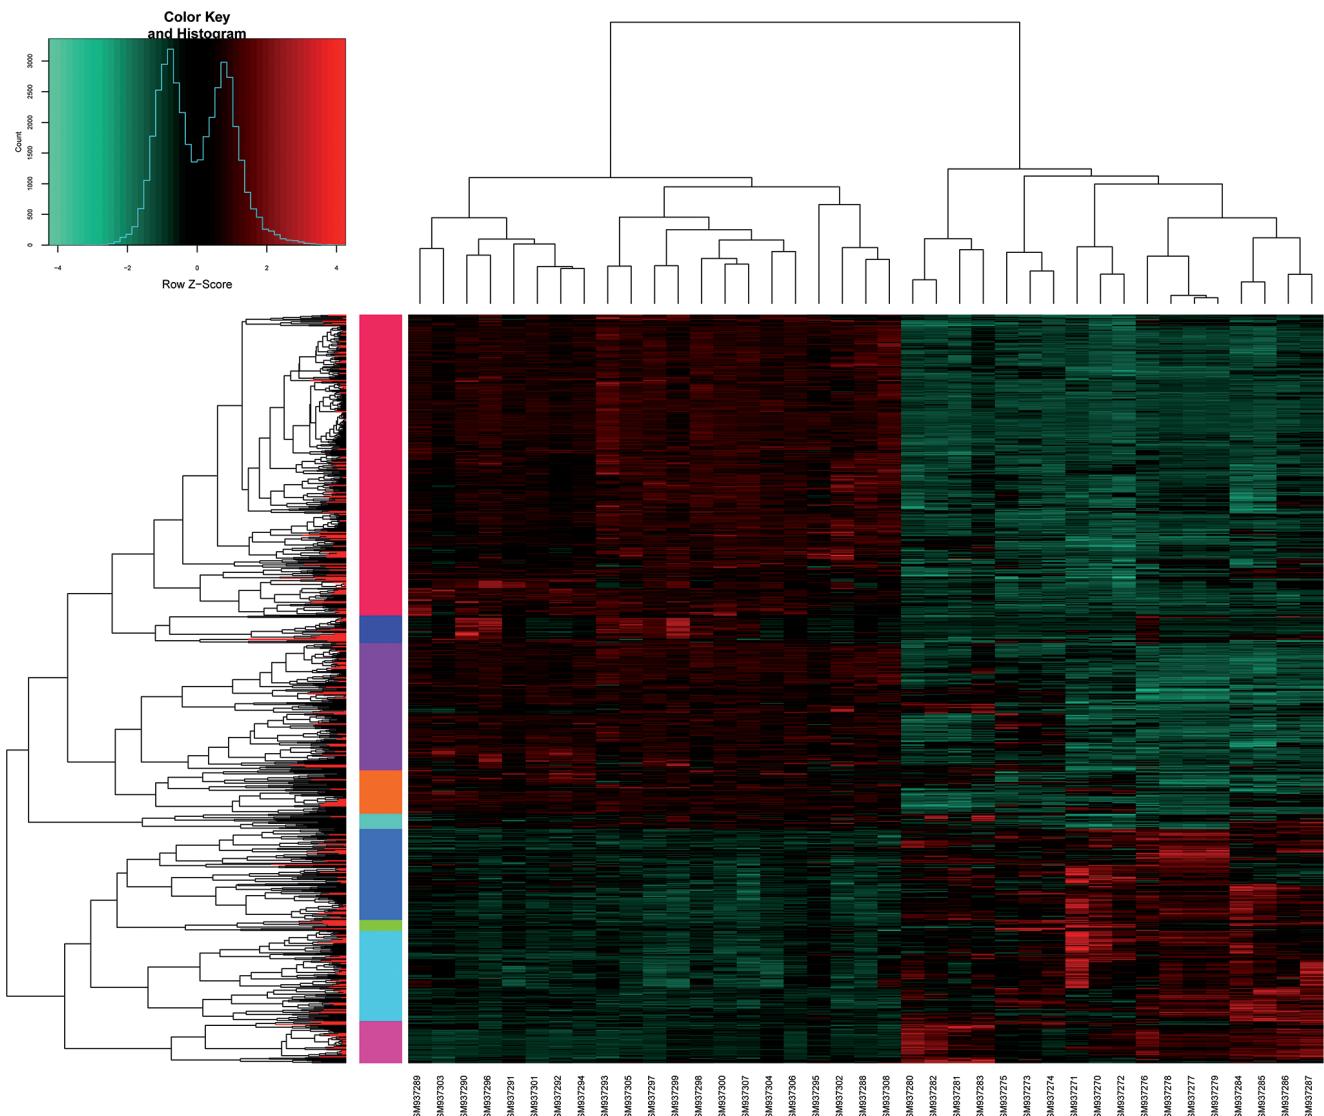

Figure 1. Heatmap of differential gene expression between prostate cancer metastasis and normal prostate samples. Each row represents the relative levels of expression of a single gene across all samples; each column represents the levels of expression for a single sample. The colors red and green denote high and low expression, respectively.

While down-regulated DEGs mainly participated in muscle contraction ($p = 4.39E-81$), muscle system process ($p = 2.61E-76$), muscle structure development ($p = 6.46E-48$) and cardiovascular system development ($p = 3.17E-31$).

The KEGG pathways obtained with $p \leq 0.05$ of the up- and down-regulated genes were shown in Table 1. On the basis of the results, the up-regulated DEGs were enriched in pathways significantly such as leishmania infection ($p = 3.45E-07$), antigen procession and presentation ($p = 1.09E-05$) and type I diabetes mellitus ($p = 5.11E-05$). Besides, the down-regulated DEGs were significantly enriched in dilated cardiomyopathy ($p = 5.24E-14$), hypertrophic cardiomyopathy (HCM) ($p = 8.67E-14$) and arrhythmogenic right ventricular cardiomyopathy (ARVC) ($p = 1.36E-07$). These pathways of the down-regulated DEGs were mainly associated with cardiomyopathy. The detailed information

of DEGs enriched in GO terms and pathways were shown in Supplemental Table 3.

PPI and functional analysis of modules. To identify the connection between DEGs and distinct functional modules, the STRING tool was performed to obtain the PPI network of DEGs. The PPI network as well as module of up-regulated DEGs was shown in Figure 2. DEGs highly connected (known as high degree nodes) to others would be more important in the network. While gene modules function as conserved molecular “circuits” responsible for specific biological function. In the module, there were 41 nodes and 713 edges. The density of the module was 0.575. Additionally, the PPI network and module of down-regulated DEGs was shown in Figure 3. In the module, there were 39 nodes and 311 edges. The density of the module was 0.308.

We then performed the GO and KEGG pathway enrichment analysis of DEGs in modules. Similarly, the top three

clusters of GO terms and pathways enriched by up – and down-regulated DEGs were shown in Table 2. The detailed information were shown in Supplemental Table 4.

The up-regulated DEGs, such as cell division cycle 45 (CDC45), baculoviral IAP repeat containing 5 (BIRC5) and cell division cycle associated 5 (CDCA5), were significantly enriched in GO functions of cell cycle phase ($p = 1.10E-88$), mitotic cell cycle ($p = 7.82E-88$) and cell cycle process ($p = 6.84E-77$). The up-regulated DEGs were significantly enriched in pathways such as cell cycle ($p = 6.09E-05$) and DNA replication ($p = 6.61E-06$). While the down-regulated DEGs mainly participated in GO terms of actin filament-based process ($p = 4.53E-130$), cytoskeletal protein binding ($p = 5.69E-92$) and myofibril ($p = 4.02E-54$), and remarkably enriched in pathways

such as dilated cardiomyopathy ($p = 7.19E-13$), hypertrophic cardiomyopathy (HCM) ($p = 1.56E-11$) and cardiac muscle contraction ($p = 4.68E-07$).

Significance analysis of pathway crosstalk under PPI and KEGG data. To identify the important pathways altered in PCa, a statistical method on pathway level was used. The significance analysis of crosstalk effects in pathways was based on the PPI database and KEGG database. The molecular crosstalk between host and candidate pathways showed that many significant pathways containing T cell receptor signaling pathway, chemokine signaling pathway, endometrial cancer and glioma were obtained (Figure 4). This results indicated the connection between immune and PC, and also suggested the commonness of cancer. Addi-

Other nodes represent up-regulated differentially expressed genes outside the module. In the module, there were 41 nodes and 713 edges. The density of the module was 0.575.

tionally, the associations between DEGs and pathways were provided in Supplemental Table 5.

DO terms of DEGs. Multiple DO terms of DEGs were obtained (as shown in Supplemental Table 6). Especially, the cancer-related terms including PCa, carcinoma, cell type cancer and malignant glioma were enriched by down-regulated DEGs, besides, cancer, malignant ovarian surface epithelial-stromal neoplasm, ovary epithelial cancer, and ovarian carcinoma were enriched by up-regulated DEGs.

Discussion

PCa is a highly prevalent cancer in older men of the western countries [28]. In the current study, we employed

bioinformatics methods to explore the molecular mechanisms and identify the potential molecular biomarkers to PCa. Our results suggested that 334 up – and 703 down-regulated DEGs were screened out. Moreover, the functions of up-regulated DEGs were significantly enriched in cell cycle phase and cell cycle process. While down-regulated DEGs mainly participated in actin filament-based process and dilated cardiomyopathy.

In our study, we found DEGs were mostly enriched in GO terms of cell cycle phase, cell cycle process and cell cycle. It is well known that cancer is characterized by uncontrolled cell proliferation due to dysregulation of the cell-cycle [29]. Moreover, replication of damaged DNA leads to mutations in the genome and the development of diseases such as cancer

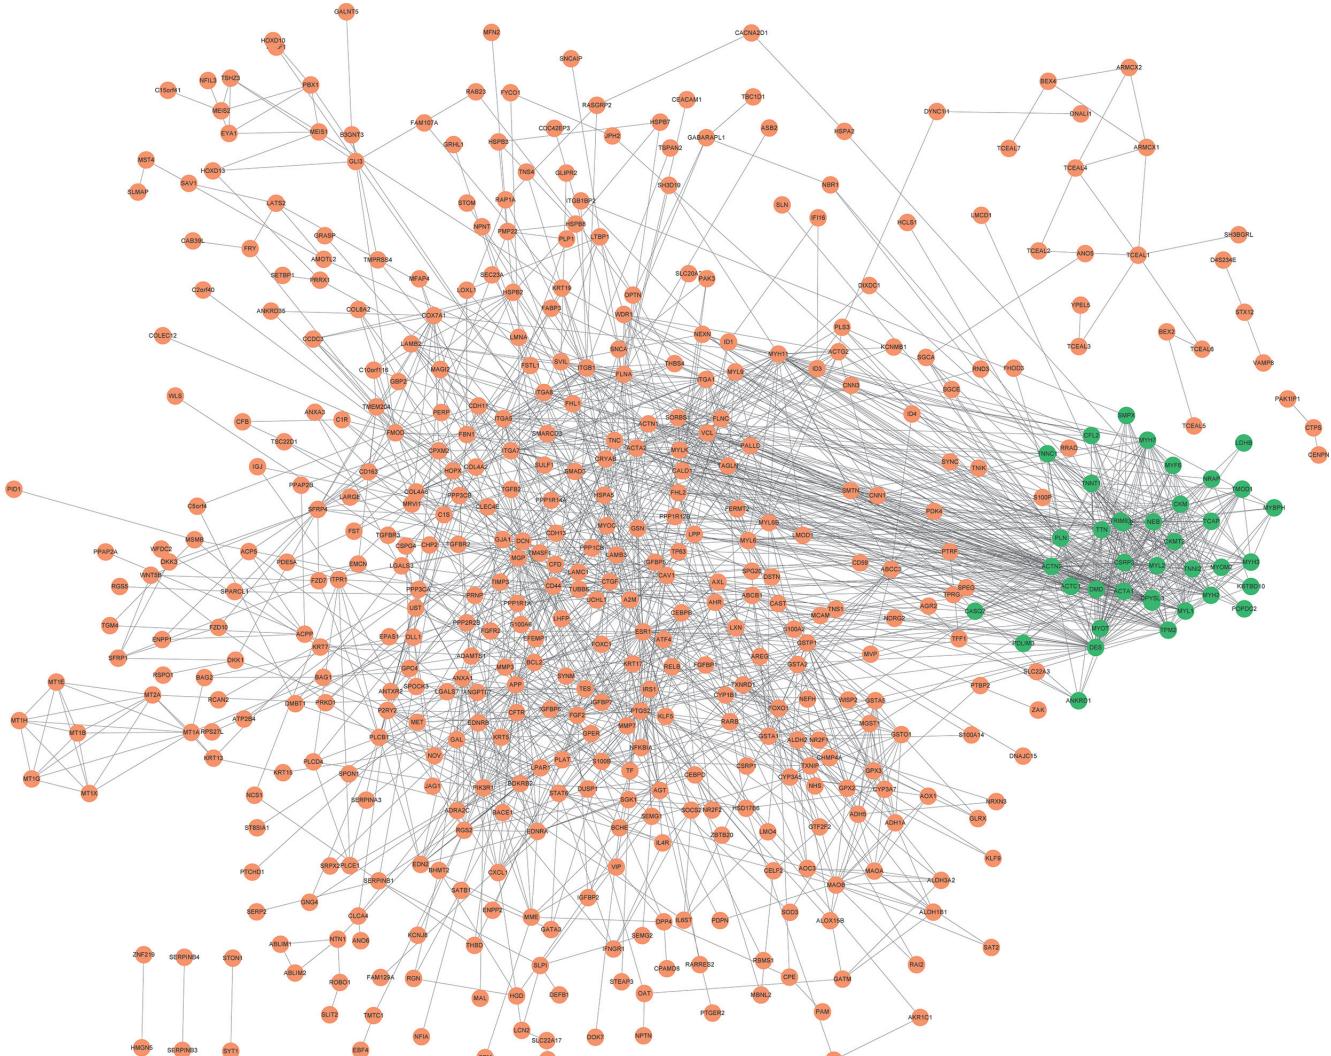

Figure 3. The protein-protein interaction (PPI) network of down-regulated differentially expressed genes.

The green circle nodes represent the module of the PPI network. Other nodes represent down-regulated differentially expressed genes outside the module. In the module, there were 39 nodes and 311 edges. The density of the module was 0.308.

[30]. CDC45, BIRC5, CDCA5 as DEGs were shown to be significantly up-regulated in PCa metastases samples in the present study. CDC45 plays an important role in the initiation as well as the extension of DNA replication [31, 32], and participated in the pathway of DNA damage-dependent signal transduction [33]. A former study has demonstrated that CDC45 expression level is strongly higher in human cancer-derived cells than in primary human cells [34]. BIRC5 gene has been reported to be associated with PCa previously [35, 36]. Our result was in accordance with previous study. Additionally, DO term annotation revealed that multiple DEGs played roles in various cancers including PCa. This may confirm the result accuracy to some extent as well. In addition, the CDCA5 gene was suggested to play some roles in cell cycle progression

via the interaction with chromatin in some immortalized cell lines [37]. Besides, Nguyen *et al.* have indicated that CDCA5 is an oncogene that is highly expressed in lung cancers [38]. These results strongly suggested that dysregulation of these genes related with cell cycle might be crucial for the progression of PCa.

In the pathway crosstalk network, several significant immunity and cancer-related pathways crosstalk with PCa, such as T cell receptor signaling pathway and chemokine signaling pathway. The T cell receptor plays a key role in the immune system. Immunotherapy of cancer is dependent on a proper target antigen and antigen presentation to the patient's immune system. Antigen presenting cells are responsible for uptake, processing and presentation of anti-

gens to T cells [39]. Chemokines are shown to play roles in regulating recruitment of immune cells during inflammatory responses [40]. Considerable evidence has also showed that the chemokine signaling pathway plays crucial roles in the tumor progression and microenvironment [41]. Moreover, chemokines as well as their receptors exhibit differential expression following PCa progression [42]. Thus, a combination of targeting multiple pathways might be a promising therapy strategy for PCa.

Additionally, we found several cancer-related pathways crosstalk with PCa, such as endometrial cancer and glioma. Recent studies found the alteration of tumor suppressor gene named PTEN or MMAC1 in human PCa cell lines obtained from metastatic tissues [43, 44]. Mutations of PTEN/MMAC1 have also been reported in endometrial carcinoma [45] and glioma [46]. Moreover, the mutations in this gene are frequent in endometrial carcinoma but rare in other common gynecological cancers [47]. Suzuki *et al.* have demonstrated that alteration of PTEN/MMAC1 might play an important role in the pathogenesis of many human malignancies [48]. In light of these results, we infer that PTEN/MMAC1 may be a biomarker for metastatic PCa, endometrial cancer and glioma.

In conclusion, the identified DEGs, especially CDC45, BIRC5 and CDCA5, may be pivotal genes for PCa, and these genes related with cell cycle may be useful markers for predicting tumor metastasis and therapeutic targets for the treatment of PCa patients. Moreover, B cell receptor signaling pathway, T cell receptor signaling pathway, endometrial

cancer and glioma were found to play important roles during PCa progression in the crosstalk network among PCa-related pathways. Our studies shed new light on the mechanism and treatment of PCa. However, the consequence described above, not only genes, but also pathways associated with PCa will be evaluated and verified conjointly through animal and clinical experiments in later work.

Supplemental table 5. Pathways and genes involving in crosstalk pathways

| Pathways | Gene list |
|---|--|
| hsa04662:B cell receptor signaling pathway | MAP2K2,JUN,CHP2,PPP3CB,PIK3R1,NFKBIA,PPP3CA |
| hsa04620:Toll-like receptor signaling pathway | CCL3,MAP2K2,JUN,CCL4,PIK3R1,NFKBIA |
| hsa05211:Renal cell carcinoma | MAP2K2,JUN,MET,EPAS1,PIK3R1,TGFB2,PAK3,RAP1A |
| hsa04062:Chemokine signaling pathway | CCL3L3,CCL3,GNB2,CCL4,RASGRP2,PLCB1,PIK3R1,CCL23,NFKBIA,RAP1A,GNG4,CXCL1 |
| hsa04810:Regulation of actin cytoskeleton | MAP2K2,FGFR2,MYLK,FGF2,ITGA7,ITGA5,CFL2,GSN,MYL9,PIK3R1,PPP1CB,VCL,BDKRB2,ACTN1,PAK3,ITGA1,ITGB1,ITGA8,MYL2,ACTN2 |
| hsa04910:Insulin signaling pathway | MAP2K2,MKNK2,FASN,SORBS1,FOXO1,PIK3R1,PPP1CB,PPP1R3C,IRS1,SOCS2 |
| hsa04510:Focal adhesion | JUN,COL1A1,LAMB3,MYLK,ITGA7,MET,ITGA5,FLNC,COL4A6,CAV1,FLNA,LAMB2,MYL9,BCL2,PIK3R1,TNC,PPP1CB,COL4A2,VCL,LAMC1,ACTN1,PAK3,ITGA1,ITGB1,ITGA8,RAP1A,MYL2,ACTN2,THBS4 |
| hsa05210:Colorectal cancer | JUN,BIRC5,SMAD3,TGFBR2,BCL2,PIK3R1,TGFB2 |
| hsa04660:T cell receptor signaling pathway | MAP2K2,JUN,MET,EPAS1,PIK3R1,TGFB2,PAK3,RAP1A |
| hsa04010:MAPK signaling pathway | ELK4,MAP2K2,STMN1,JUN,MKNK2,CACNA1D,HSPA6,FGFR2,FGF2,RASGRP2,ZAK,FLNC,CHP2,TGFBR2,FLNA,PPP3CB,TGFB2,CACNA2D1,ATF4,RAP1A,HSPA2,DUSP1,RELB,PPP3CA |
| hsa05213:Endometrial cancer | MAP2K2,PIK3R1 |
| hsa04370:VEGF signaling pathway | MAP2K2,CHP2,PPP3CB,PIK3R1,PTGS2,PPP3CA |
| hsa04722:Neurotrophin signaling pathway | MAP2K2,JUN,BCL2,PIK3R1,NFKBIA,ATF4,RAP1A,IRS1 |
| hsa05214:Glioma | CDKN2A,MAP2K2,PIK3R1 |
| hsa05220:Chronic myeloid leukemia | CDKN2A,MAP2K2,SMAD3,TGFBR2,PIK3R1,TGFB2,NFKBIA |
| hsa05221:Acute myeloid leukemia | MAP2K2,PIK3R1 |
| hsa04012:ErbB signaling pathway | MAP2K2,JUN,PIK3R1,PAK3,AREG |
| hsa05216:Thyroid cancer | MAP2K2 |
| hsa04150:mTOR signaling pathway | IRS1,CAB39L |
| hsa05160:Hepatitis C | PPP2R2B,PIK3R1,CLDN1,NFKBIA |

Disease Ontology (DO) annotation of up-regulated differentially expressed genes
